Symptym is a voice-driven AI telemedicine app that connects you with doctors fast, by saving time. We save time by doing the process of the triage by an AI that talks back/ asks the right questions and understands your medical history and bodily weaknesses acting as your personal health companion through your lab reports and wearable data.

- **illness:** You talk to the agent and it asks you questions about how you feel and it asks you questions required for diagnosis (all the information that a doctor needs to make a decision). The App will then generate a report consisting of all the information, what the problem is and what the solution is. The doctor comes on video call and can see the patient and can ask questions to make a decision. The doctor can then prescribe medicine and the patient can directly order those medicines from the app (which will come within a few hours). If it's a big health issue, the app will ask the patient to reach for emergency services or can automatically schedule an appointment with the correct doctor. The doctor can schedule the medication routine directly through the app.
- **medicine:** can schedule order medicine and medicine will arrive at your doorstep without paying attention to it.

	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** • Voice Agent • Video Call interface • Auth/AWS backend	**Schedule - (For V2.0)** • Doctor side of the app • Medicine order interface • Insurance billing/Insurance linking me interface
Not Important	**Delegate - (Use a library)**	**Delete - (Cut it)** • Doctor's interface filing

	• Using the list of all diseases from cambridge • Using the list of all drugs sold in america • Using an existing Video streaming service	a insurance claim
